Structured Cabling

High Performance Infrastructure for Voice & Data

A high percentage of the problems experienced with voice, data and video transmissions can be traced to connectivity problems. A properly structured cabling design by well trained engineers will provide for performance, reliability, and investment protection for your company.

Direct Line Communications is a SYSTIMAX (formerly Avaya and Lucent SYSTIMAX) and PSC Panduit certified installer. Our SYSTIMAX and PSC Panduit installations are supported by extended warranties which guarantees your structured cabling system and certifies both end to end performance and application assurance for you. Our technicians are certified on every product installation that we engineer and are well trained on the industry structured cabling standard ANSI/EIA/TIA-568B.1 - B.3. Depending on your requirements, you can select from a mix of services that include:

- Design and engineering of a complete end to end structured cabling system to meet any communication need.
- The development of cable management records for your facility as well as CAD drawings.
- Installation, termination, and certification of any copper, fiber, or coax premises cabling including: Gigaspeed, Category 6, CATV, and Ethernet.
- Installation, termination, splicing (mechanical or fusion) and certification of Fiber Optics to the desktop or as a component of your structured cabling system including both single and multi-mode fiber.
